Hacky Hour 23 July 2020

**Someone hands you a manuscript  
to read, what do you do?**

**Your figures communicate  
your science and advertise it**

# Good vs Bad Plots

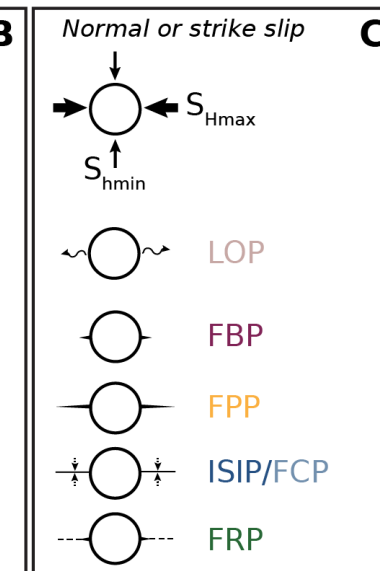

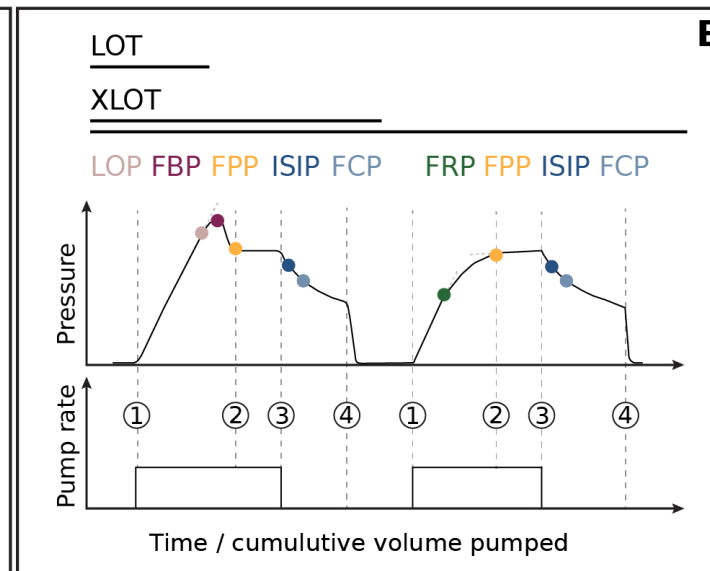

<https://ourcodingclub.github.io/tutorials/datavis/>

# Plots vs Communication

# Plots vs Communication

Too many:

- FONTS
- COLOURS
- S^MB@L T^PES
- Sizes
- Line widths
- MISALIGNED ELEMENTS
- Extra!!! Stuff!!!

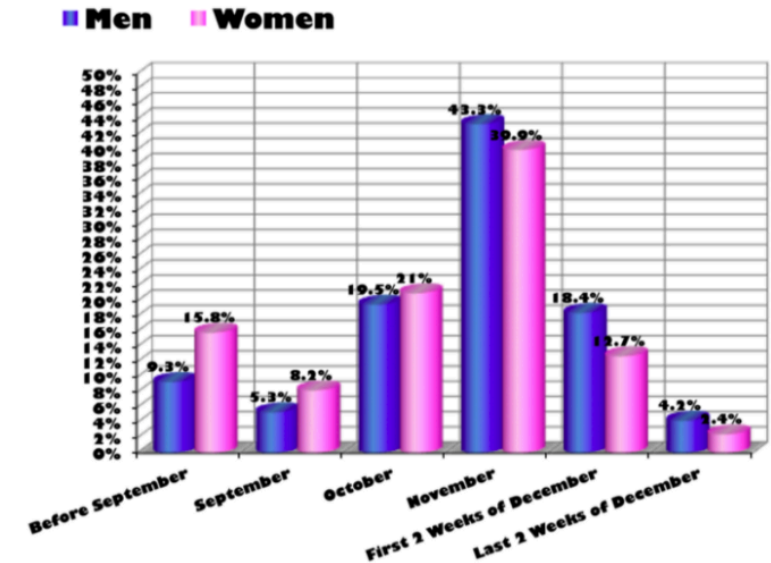

*Cognitive  
Noise*

# Cognitive noise

## Ask yourself...

- What am I trying to do: communicate my research or make it look fancy?
- What would make it easier/faster for my audience to understand me?
- What can I remove?

Shoppers Begins Shopping for Holidays

More women start their holiday shopping early

Before and after created by [Storytelling with Data](http://www.storytellingwithdata.com).

# Cognitive noise

## Tips

- Use whitespace: When you know your data, it's easy to digest but others need space to think
- Have a consistent style and colour palate throughout your paper/poster
- Use one font, preferably sans-serif

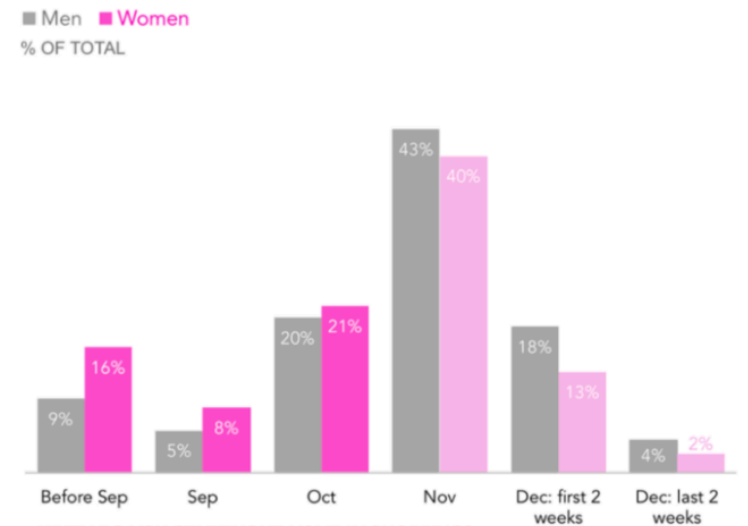

The default font for matplotlib is DejaVu Sans. This is not a standard font in graphics or word processing packages but can be downloaded and installed as a font pack.

**Generate plot**

**Format and annotate**

**Share**

# Plan

- What do you want to communicate?

You can't include everything

- Who are you wanting to communicate with?

Sketch an avatar

- Are there any restrictions?

Medium (poster/paper/presentation) dictates general layout, colour etc

Journal guidelines can be very specific about figures

- How much space do you have?

Plan appropriate line weights and font sizes

# Plan

Planning and making figures in advance can also make it easier to write a manuscript

A method my supervisor suggested that works for me:

1. Brainstorm a catchy title and whiteboard the outline
  - Headings
  - Description of each section
  - Figures and figure captions
2. Make the figures
3. Write to the figures and headings

**Spend the time needed,  
no more and no less**

# Colour

## Considerations

- Requirements/cost (check journal guidelines)
- Communication & cognitive noise
- Colour blindness
- Printing in black and white

## Colour palate demo

- Example (.txt and .ai)
- Making colours and converting between colour formats (Hex, RGB, CMYK etc)

# Colour

## Resources

- Colour blindness simulator  
<https://www.color-blindness.com/coblis-color-oblindness-simulator/> (recommended)
- Colour brewer <https://colorbrewer2.org/#type=sequential&scheme=BuGn&n=3>
- Colour brewer <https://learnui.design/tools/data-color-picker.html>
- Hex colour viewer and brewer <https://www.color-hex.com/> (recommended)
- Colour viewer and brewer <https://color.adobe.com/create/color-wheel> (recommended)
- Test a colour pallet <https://projects.susielu.com/viz-palette>
- Colour thief fun: Adobe capture app
- Colour thief fun: <https://lokeshdhakar.com/projects/color-thief/>
- Matplotlib named colours [https://matplotlib.org/3.1.0/gallery/color/named\\_colors.html](https://matplotlib.org/3.1.0/gallery/color/named_colors.html)

**Generate plot**

**Format and annotate**

**Share**

**Demo**

File -> Place

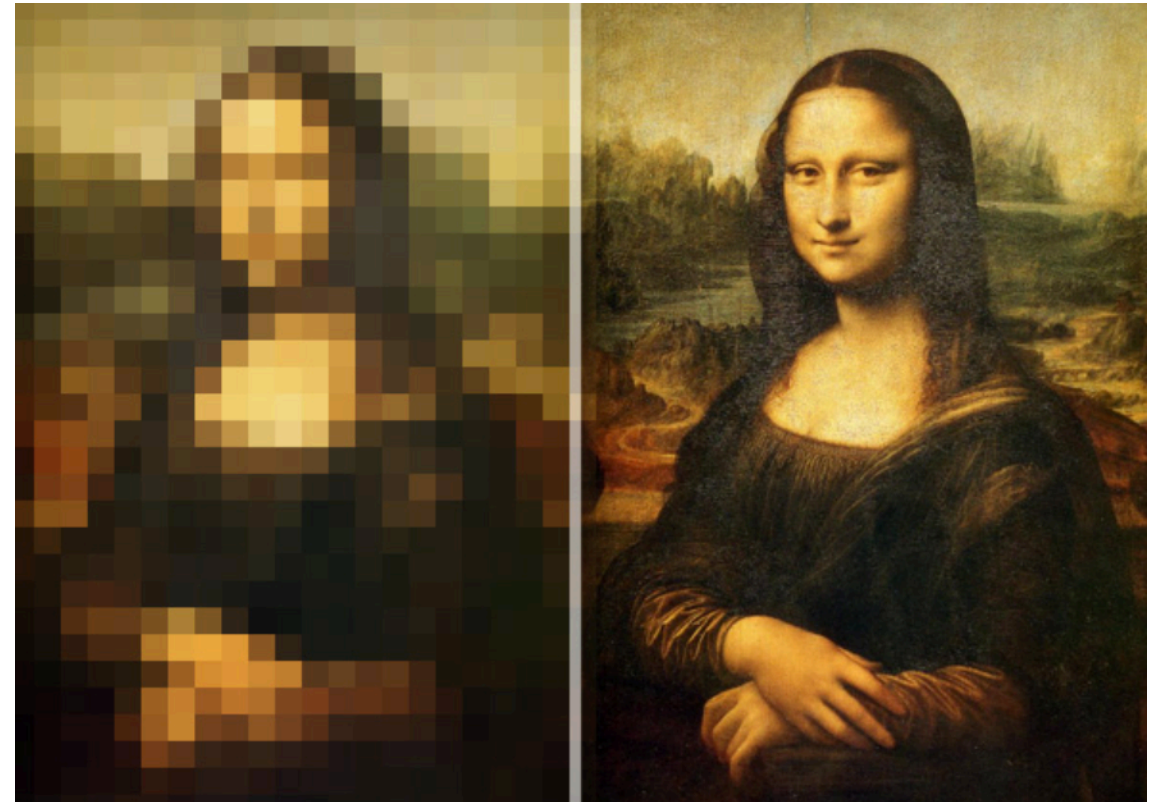

# Image Format & Resolution

## Match the format to the task

- png – recommended format for plots (large areas with a single colour) and is an open-source format that's widely accepted
- jpeg – recommended for photos (large amount of colour variation) but suffers loss and degradation when repeatedly edited
- tiff – often large files and typically used for raster data storage or high-quality printing, so avoid dropping tiff images into your document

## Rules of thumb for png resolution

- 300 dpi general use
- 600+ dpi posters and within workflow
- Check journal guideline for manuscripts

**Discussion / Questions**
